

# DataOps Automation Software

The **DATAKITCHEN DATAOPS AUTOMATION** is the only complete enterprise DataOps solution that enables your organization to quickly, intuitively, and successfully implement and manage an end-to-end DataOps program, using tools you already own.

The DataKitchen DataOps Automation Software is your command center for DataOps. It harmonizes a complicated set of tools and processes into a single seamless system, so cross-functional teams can seamlessly collaborate, quickly innovate, and instantly deliver the kind of error-free, on-demand insight that leads to one successful business decision after another.

## Why Orchestrate DataOps?

Reduce analytic cycle time from months to hours

Eliminate data errors

Foster collaboration across complex teams using diverse tools

Dramatically increase data team productivity

Make better, faster decisions

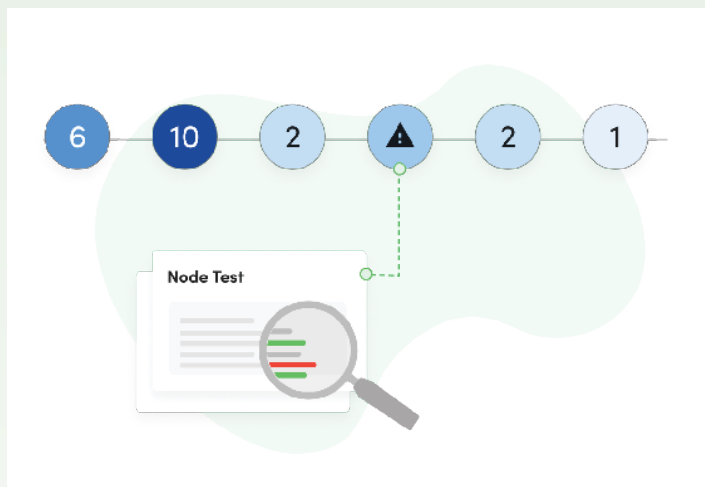

# What the DataKitchen Automation Delivers

## META-ORCHESTRATE YOUR END-TO-END DATA FACTORY

Meta-orchestrate all your tools, tests, and workflows across your production, development, and environment pipelines, allowing your teams to work faster and collaborate more effectively.

## ELIMINATE SILOS BETWEEN TEAMS

Foster collaboration with a common place to work and a single view of the end-to-end data processes. Users work independently in separate but aligned workspaces. When ready, they integrate their collective work with confidence. They can also easily share reusable components – a significant productivity multiplier.

## REDUCE ANALYTIC ERRORS TO VIRTUALLY ZERO

Improve data quality by catching costly and embarrassing errors early. Any team member can embed automated tests at every step in your production and development pipelines. Preset alerts increase agility and reduce data downtime.

## PROVISION DEVELOPMENT AND SELF-SERVICE ENVIRONMENTS ON-DEMAND

Empower developers and self-service teams to confidently experiment and develop new features. On-demand provisioning of complete, governed workspaces, called Kitchens, enables users to work independently yet collaborate effectively.

## DEPLOY AS FAST AS THE SPEED OF BUSINESS

Automate the end-to-end deployment process so users can test and release new analytics with the push of a button. Kitchens align and integrate toolchain environments so new analytics can easily migrate to production, without fear of breaking anything.

## IMPROVE PERFORMANCE

Process lineage and other operational metrics, such as collaboration, productivity, errors, and deployment time, enable the team to see how they are improving over time.
